

FAQ RTCP

In the DExxx phones it is possible to obtain statistical information on packets from the phone during a call. With the RTCP support the phone will send standard RTCP Sender Reports periodically. They contain the relevant call information including packet loss, fraction lost, jitter, timestamps info. and other information.

*The **RTP Control Protocol (RTCP)** is a sister protocol of the **Real-time Transport Protocol (RTP)**. Its basic functionality and packet structure is defined in the RTP specification [RFC 3550](#),^[1] superseding its original standardization in 1996 ([RFC 1889](#)). RTCP provides out-of-band statistics and control information for an RTP flow. It partners RTP in the delivery and packaging of multimedia data, but does not transport any media streams itself. Typically RTP will be sent on an even-numbered **UDP** port, with RTCP messages being sent over the next higher odd-numbered port.^[2] The primary function of RTCP is to provide feedback on the **quality of service (QoS)** in media distribution by periodically sending statistics information to participants in a streaming multimedia session. RTCP gathers statistics for a media connection and information such as transmitted **octet** and packet counts, lost packet counts, **jitter**, and **round-trip delay time**. An application may use this information to control quality of service parameters, perhaps by limiting flow, or using a different **codec**. RTCP itself does not provide any flow encryption or authentication methods. Such mechanisms may be implemented, for example, with the **Secure Real-time Transport Protocol (SRTP)** defined in [RFC 3711](#)...[Wikipedia](#)...*
