

# T300/T500 Asterisk Dialplan

## Introduction

The Gigaset T500/T300 is based on asterisk and sometimes it is needed to change the incoming configuration of the SIP trunks, below are some examples how to change the dialplan.

## Question

The incoming dialled number has extra "0" that needs to be removed.

The normal rule in the dialplan is:

```
exten => __,3,Goto(Trunk-incoming-manuell,${EXTEN},1)
```

To remove the first digit you need to change the rule to:

```
exten => __,3,Goto(Trunk-incoming-manuell,${EXTEN:1},1)
```

The ":1" removes the first digit, to remove the first 2 digits you need to change it to ":2"

Example:

- Without change: 09742123456
- With change: 9742123456

With the following change you can add numbers to the incoming dialled number:

The normal rule in the dialplan is:

```
exten => __,3,Goto(Trunk-incoming-manuell,${EXTEN},1)
```

To remove the first digit you need to change the rule to:

```
exten => __,3,Goto(Trunk-incoming-manuell,+49${EXTEN},1)
```

The "+49" adds the German country code to the incoming number.

Example:

- Without change: 9742123456
- With change: +499742123456
