DExxx - Function keys can be blocked for auto provisioning

Introduction

In some cases, it is requested that function keys can not be overwritten by auto provisioning.

Example:

- Static key for log in/out in groups.
- Programming a second SIP account under a key.
- Keys that are programmed manually and not available in the auto provisioning.
- ...

For this, a new feature is implemented that keys can be blocked for auto provisioning via the web-interface of the device

Feature is available for:

- DE900/700 SW 02.00.11 or higher
- DE410/310 SW 02.00.08 or higher

Configuration

Open the web-interface of the device and go to: Settings - Function keys

Here you will see the new column
"Block"

When **enabled** the keys can **not** be overwritten by Auto provisioning.

When **disabled**, the keys can be changed by Auto provisioning.
