## Base station synchronization

Synchronization and the logical structuring of the base stations in clusters are prerequisites for the functioning of the multicell system, the radio connection between base stations and mobile phones and the handover. To carry out the synchronization you will need the plan of the clusters with the synchronization level for each base station.

Base stations can be synchronized "over the air", meaning that they are synchronized via DECT. If the DECT connection between specific base stations seems to be not reliable enough, synchronization can also take place via LAN.
